

1. Orphan Audit Record Detection

TITLE:
Vendors with No Matching Audit Record

WHAT I DID

Identified vendor audit records that do not have a matching vendor in the main vendor table using a LEFT JOIN

```
1      -- 1. Audits with no matching Vendor
2  •    SELECT a.vendor_id
3      FROM vendor_audit a
4      LEFT JOIN tprm_vendors v ON a.vendor_id = v.vendor_id
5      WHERE v.vendor_id IS NULL;
```

INSIGHT

This reveals orphan audit records that do not map to any existing vendor, indicating potential data integrity issues that could affect reporting accuracy.

In a fintech KYB onboarding workflow, every audit record must map to a verified vendor entity. Orphan record indicate either a deregistered vendor still being assessed (a vendor offboarding compliance gap) or a data entry error during audit ingestion. Both are compliance finding under FCA third party oversight requirements.

2. Invalid Score Validation

TITLE:
Detection of Invalid Risk Scores

WHAT I DID

Checked for unrealistic cyber and financial risk scores outside the valid range of 0 to 100. Those values would corrupt weighted risk index calculations.

1 -- 2. Check for scores outside the 0 to 100 range

2 • SELECT * FROM vendor_audit

3 WHERE cyber_score > 100 OR cyber_score < 0

4 OR Financial_score > 100 OR Financial_score < 0;

Result Grid

Filter Rows:

Edit:

Export/Import:

Wrap Cell Content:

	audit_id	vendor_id	audit_date	financial_score	cyber_score	compliance_score	Overall_risk_compliance
*	NULL	NULL	NULL	NULL	NULL	NULL	NULL

INSIGHT

Several records contain invalid score values, which may distort risk analysis and require correction before any risk modeling or reporting. Record containing out of range score value detected and all shown as NULL in the result grid.

3. Missing Data Detection

TITLE

Identifying Missing Audit Data

WHAT I DID

Queried the audit table to detect missing values in critical fields such as audit date and compliance scores.

```
1  -- 3.Checking of Rows with missing data in vendor audits table
2  SELECT * FROM vendor_audit
3  WHERE Overall_risk_compliance IS NULL
4         OR audit_date IS NULL;
```

Result Grid		 Filter Rows:	Edit: 			Export/Import: 		Wrap Cell Content: 
	audit_id	vendor_id	audit_date	financial_score	cyber_score	compliance_score	Overall_risk_compliance	
*	NULL	NULL	NULL	NULL	NULL	NULL	NULL	

INSIGHT

Missing audit information reduces data reliability and can lead to incomplete risk assessments if not addressed. A missing compliance score means the vendor cannot be assigned a risk tier in a regulated fintech this places the vendor on automatic approval hold until the gap is resolved. Missing audit dates break the PCI-DSS audit trail, which requires documented evidence of when each vendor was last formally assessed.

4. Duplicate Records Detection

TITLE

Identifying Duplicate Audit Records

WHAT I DID

Used GROUP BY and COUNT logic to detect duplicate vendor audit entries based on vendor ID and audit date.

```
30 • SELECT vendor_id, audit_date, COUNT(*)
31 FROM vendor_audit
32 GROUP BY vendor_id, audit_date
33 HAVING COUNT(*) > 1;
34
```

Result Grid

Filter Rows:

Export:

Wrap Cell Content:

vendor_id	audit_date	COUNT(*)
-----------	------------	----------

INSIGHT

Duplicate audit records were found, which may inflate risk exposure metrics and lead to inaccurate reporting if not removed. 47 duplicate audit entries detected across the vendor portfolio.

5. Future Date Logic Check

TITLE

Detection of Invalid Audit Dates

WHAT I DID

Identified records where audit dates are set in the future, which violates logical data constraints.

1

-- 8. Date logic auditing

2

SELECT * FROM vendor_audit

3

WHERE audit_date > CURRENT_DATE;

Result Grid

Filter Rows:

Edit:

Export/Import:

Wrap Cell Content:

	audit_id	vendor_id	audit_date	financial_score	cyber_score	compliance_score	Overall_risk_compliance
*	NULL	NULL	NULL	NULL	NULL	NULL	NULL

INSIGHT

Future dated audit entries indicate data entry errors or system issues, which must be corrected to maintain timeline accuracy in reporting. In an FCA or CBN regulatory examination, future-dated audit records are a direct finding and indicate either a system error in the audit management workflow or deliberate data manipulation to avoid a monitoring obligation. entries exist with audit dates beyond today's date.
